Sequence 4, Application US/09582200A

Patent No. 6482609

GENERAL INFORMATION

APPLICANT: Munree, Donald G.

APPLICANT: Rembej, Rajender

APPLICANT: Gupta, Ashwani

TITLE OF INVENTION: IDENTIFICATION OF LYSOLIPID RECEPTORS INVOLVED IN INFLAMMATORY RE

FILE REFERENCE: 108074-00002

CURRENT APPLICATION NUMBER: US/09/582,200A

CURRENT APPLICATION NUMBER: US/09/582,200A

CURRENT PILING DATE: 1998-12-30

PRIOR FILING DATE: 1998-12-30

PRIOR FILING DATE: 1998-12-30

PRIOR FILING DATE: 1998-12-30

PRIOR FILING DATE: 1998-04-03

PRIOR PILING DATE: 1998-04-03

Patent No. 6812335

GENERAL INFORMATION:

APPLICANT: Goct21, Edward L.

APPLICANT: An, Songzhu

TITLE OF INVENTION: Human Polypeptide Receptors for Lysophospholipids and
TITLE OF INVENTION: Sphingolipids and Nucleic Acids Encoding the Same
FILE REFERENCE: A-67501/DUB/1P1

CURRENT APPLICATION NUMBER: US/09/274,752D

CURRENT FILING DATE: 1999-03-23

NUMBER OF SEQ ID NOS: 29

SOFTWARE: Patentin Ver. 2.0

Protein Sequence Searches - February 2005

All of the sequence databases on ABSS have recently been updated.

- Please note that the curators of the UniProt database have purged some temporary accession numbers from the most recent version of UniProt. These sequences have been assigned new permanent accession numbers. The new UniProt record may not contain the previous temporary accession number.
- If you encounter an accession number from an older search run against UniProt (results file extension .rup) that can no longer be found in the database, the permanent record with the new accession number can be found by searching the old accession number in the UniProt Protein Archive database (UniPARC) at:

http://www.pir.uniprot.org/database/archive.shtml

If you have any questions regarding this information or your results, please contact any STIC searcher.

When submitting sequence search results for scanning into IFW, please include a copy of this attachment to assist any future Examiners or members of the public who may encounter UniProt temporary accession numbers.

FUNCTION: Receptor for the lysosphingolipid sphingosine 1-bhosphate (SIP). SIP is a bicactive lysophospholipid that elicits diverse physical effect on most types of cells and tissues. When expressed in rat HTC4 hepatoma cells, is capable of mediating SIP-induced cell proliferation and suppression of apoptosis. SUBCELLULAR LOCATION: Integral membrane protein. SIMILARITY: Belongs to the G-protein coupled receptor 1 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  61 NSKFHSAMYLFLGNLAASDLLAGVAFVANTLLSGSVTLRLTPVQWFAREGSAFITLSASV

G protein-coupled sphingolipid receptor (EDG1 protein) (Endothelial differentiation, sphingolipid G-protein-coupled receptor, 1)
Name=CHEDG1; Synonyms=EDG1; ORFNames=RP4-575N6.1-001;
Homo sapiens (Human).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Halleck A., Ebert L., Mkoundinya M., Schick M., Eisenstein S., Neubert P., Kstrang K., Schatten R., Shen B., Henze S., Mar W., Korn B., Zuo D., Hu Y., LaBaer J.; Submitted (JUN-2004) to the EMBL/GenBank/DDBJ databases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Tigyi G.J. Cloning of the rat edg-1 immediate-early gene: expression pattern
suggests diverse functions.";
Gene 149:331-336(1994)
C.I. FUNCTION: Receptor for the lysosphingolipid sphingosine 1-
phosphate (SIP). SIP is a bioactive lysophospholipid that elicits
diverse physiological effect on most types of cells and tissues.
This inducible epithelial cell G-protein-coupled receptor may be
involved in the processes that regulate the differentiation of
cendothelial cells. Seems to be coupled to the G(i) subclass of
hereromeric G proteins (By similarity).
C.I. SUBCELLULAR LOCATION: Integral membrane protein.
C.I. DEVELOPMENTAL STAGE: First detected at embryonic day 15. At
postnatal day 14 detected in skin, spleen, liver, kidney, heart,
testicle, lung and brain. At adulthood is most abundant in brain.
C.I. SIMILARITY: Belongs to the G-protein coupled receptor 1 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Phosphoserine (Potential).

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A novel isolated lysolipid (LL) receptor/EDG receptor (EDG-4). The LL/EDG receptors are involved in an inflammatory response signaling pathway and an apoptotic signaling pathway. They can be used for identifying agonists or antagonists of NF-KB or IL-8 modulated EDG or LL receptors. Agonists can be used for upregulation of an inflammatory process condition or immune response. Antagonists can be used for the downregulation of an

The present sequence is a numeral process. The present sequence or activity of H218 by determining the presence or advanced or activity of H218 by determining the presence or absence of mutation in the polymucleotide encoding H218 in the genome of the subject and/or analysing for the presence of H218 expression in sample derived from the subject. It is also used for treating subjects in need of enhanced activity or inhibition of H218 by administering an agonist or antagonist respectively. H218 can be used to treat abnormal conditions such as bacterial, fungal and viral infections, particularly HV-10 c. 2, cancers, diabetes, obesity, anorexia, bullimia, asthma, Parkinson's disease, actue heart failure, hypotension, hypertension, urinary retention, osteoporosis, angina pectoris, myocardial infarction, circle, ulcers, asthma, allergies, benign prosetatic hypertrophy, mybridisation probes and primers for isolating full-length clones concoling H218. The difference in cDNA or genomic sequence between affected and unaffected individuals is determined to identify mutation causing the disease. It is also valuable for chromosome identification. The polypeptide is used for the identification of membrane bound or causing the disease through standard receptor binding techniques and also controlled the ecceptors through standard receptor binding techniques and also controlled the process of the controlled to inhibitor of the VFIVCWLPAFSILLLDYACPVHSCPILYKAHYFFAVSTLNSLLNPVIYTWRSRDLRREVL 300 241 VFIVCWLPAFSILLLDYACPVHSCPILYKAHYXFAVSTLNSLLNPVIYTWRSRDLRREVL 300 present sequence is a human EDG family protein designated H218.         RESULT 3
```

```
The present sequence represents an Edg polypeptide. The specification describes Edg4 and Edg5 polypeptides. The Edg4 gene is located on chromosome 19pl2. The Edg polypeptides are receptors for 1yeophospholipids and sphingolipids, such as lysophosphatidic acid (LPA) and sphingosine 1-phosphate (S1P). The Edg receptor proteins are used for diagnosing an LPA or S1P mediator condition an individual. Edg4 and Edg5 polypeptides can be used in screening assays designed to determine the effects of a candidate bioactive agent on the expression and activity of Edg4 and Edg5 polypeptides, and the function of LPA and S1P. Nucleotide sequences encoding Edg-4 and Edg-5 are useful a hybridisation probes, in chromosome and gene mapping and in the generation of anti-sense RNA and DNA. Nucleic acids which encode Edg4 or Edg5 or their modified forms can also be used to generate either transgenic animals or knock out animals.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to Edg receptors (ABP59277-ABP59290). The Edg receptors, are useful in a high-throughput screening assay to identify compounds that bind to or modulate the activity of the polypeptide, in calcium mobilisation assays, binding assays, detection of cAMP formation, or in reporter gene techniques

The method is especially useful for screening preventives or remedies for IgA nephritis. The present sequence is human Edg-5, which was used in the method of the invention

cert counting the chemical/phenotypic effect of the compound upon the cell. determining the chemical/phenotypic effect of the subject a therapeutically also disclosed are methods for modulating lymphocyte activation or anigration in a subject, by administering to the subject a therapeutically effective amount of an identified compound, an EDG polypeptide or a modulators of lymphocyte activation, by transfecting into lymphocytes a consoling for modulating T or B cell receptors of the lymphocytes activation of lymphocyte activation by detecting the level of CDNA library, stimulating T or B cell receptors of the lymphocytes, convening colns that modulate conformed is useful for identifying a compound conform an antibody, antisense molecule, small organic molecule, sphingolipid or a sphingolipid analogue) that modulates lymphocyte activation or migration. The compounds identified are useful for the cativation or migration. The compounds identified are useful for the transment (e.g. gene therapy) of diseases such as asthma, allergy, autoimmune diseases such as multiple sclerosis, scleroderma, pernicious and tissue transplant such as graft-versue-host disease, acute and chronic inflammation, an infection such as viral, fungal, protozoal or bacterial infections and diseases in which activation of immune response and stimulation of lymphocyte migration is desired. The sequence and stimulation are bursal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    G protein-coupled receptor; GPCR; antigenic peptide; gene therapy; G protein-coupled receptor modulator; antibody; immune-related disease; growth-related disease; cell regeneration-related disease; ADS; cancer; immunological-related cell proliferation; classes; autoimmune disease; Alzheimer's disease; atherosclerosis; infection; osteoarthritis; allergy; osteoporosis; cardiomyopathy; inflammation; Crohn's disease; diabetes; graft versus host disease; Parkinson's disease; multiple sclerosis; psoriasis; anxiety; depression; schizophrenia; dementia; memory loss; mental retardation; epilepsy; asthma; tuberculosis; obesity; nausea;

```
The invention relates to a novel method for gene expression analysis by collective quantitative analysis of the expression of a number of genes to identify those that are prometed or inhibited in a given cell or tissue. The genes are preferably gene families such as the G protein gene family. The methods may be used in treatment of cancers, including prostate, ovarian, stomach, bladder, breast, and cancer of the intestines. EDG-1 and EDG-2 receptor agonists and antagonists may be used in treatment treatment and prevention of atheroscelerosis, myocardial infarction, infarct or ischaemic disease of the brain. This sequence represents a protein of human EDG-5 of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        caids. Also described: (1) an assay for the detection of a particular of acids. Also described: (1) an assay for the detection of a particular of acids. Also described: (1) an assay for the detection of a particular of protein-coupled receptor (GPCR) or a candidate polypeptide in a sample; and (2) an isolated antibody having high specificity and high affinity or avidity for a particular GPCR. (1) can be used as GPCR modulators and in the becapy. The antigenic peptides for GPCRs are useful in detecting an antibodies. The peptides and antibodies are also useful for detecting to antibody against a particular GPCR. The antigenic peptides for cantibodies. The peptides and antibodies are useful for detecting the presence or absence of corresponding GPCRs. The antigenic peptides for GPCRs and antibodies are useful for diagnosing and designing the greating immune-related disease, immunological-related disease, cell regeneration-related disease, immunological-related cell proliferative diseases, or autoimmune diseases, immunological-related cell proliferative catheroscierosis, bacternal, fungal, protozoan or viral infections, osteoporosis, cancer, cardiomyopathy, chronic and acute inflammation, allergies, Crohm's disease, diabetes, graft versus host disease, parkinson's disease, multiple sclerosis, parkinson's disease, multiple sclerosis, prantice, or loss, epilepsy, asthma, tuberculosis, obesity, nausea, hypertension, candisorder; in which GPCRs are involved. The antibodies may be used in immunosasays and immunodiagness, help antibodies and the condition of the conditi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         o;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated antigenic peptides e.g., for G protein-coupled receptors (GPCR), useful for diagnosing and designing drugs for treating conditions in which GPCRs are involved, e.g. AIDS, Alzheimer's disease, cancer or autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             180

The present invention describes a method for identifying an increase in risk for Type II diabetes mellitus and/or venous thrombosis/pulmonary embolism, comprising determining the presence of amino acid exchange at position 266 from Val to Ala in the EDG5 protein. Also described: (1) a preventing type II diabetes and/or venous thrombosis/pulmonary embolism, where a cell or cell extract is used that contains EDG5 with the amino acid exchange, or the variation in the nucleotide sequence of EDG5 protein or the EDG5-286-AA; (2) a method for adapting the dosage of the pharmaceutical described above by testing the human cell for the presence of EDG5 protein or the EDG5-286-AA; (2) a method of selecting paramaceutical described above by testing the human cell for the presence of EDG5 protein or the EDG5-286-AA; (3) a method of selecting patients who will respond type II diabetes and/or venous thrombosis/pulmonary embolism by testing the probe of the respective
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Identifying an increase in risk for Type II diabetes mellitus and/or venous thrombosis/pulmonary embolism comprises determining in a probe the presence of amino acid exchange at position 286 from Val to Ala in the

patient for the presence of EDG5 with the amino acid exchange, or the variation in the nucleotide sequence of EDG5 protein or the EDG5-286-AA; and (4) a test kit for testing the presence of the amino acid exchange, or the variation in the nucleotide sequence of EDG5 protein or the EDG5-286-AA. EDG5 has antidiabetic and thrombolytic activities, and can be used in gene therapy. The methods are useful for identifying an increase in risk for type II diabetes mellitus and/or thrombosls/plumnary embolism, and for screening pharmaceuticals useful for treating type II diabetes mellitus and/or venous thrombosls/plumonary embolism. The methods are also useful for adapting the dosage of a pharmaceutical useful for treating the above diseases. The methods are useful for sequence represents who will respond to the pharmaceutical. The present sequence represent invention. It is used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                 120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  240

gene;

```
This invention relates to a novel method for identifying an increase in risk for type II diabetes mellitus, venous thrombosis, pulmonary embolism or a combination thereof. Specifically, it refers to a the endothelial differentiation gene 5 (EDG5) located on chromosome 19p13.2, which encodes a G protein coupled receptor protein. The present invention describes an immunochemically reactive labelled antibody based kit that can be used to identify the Val286Ala variation in the EDG5 protein encoded by a single nucleotide polymorphism. Furthermore, this allel encoding the V286A variant represents a genetic marker that can be useful for preventative treatments of the aforementioned diseases, as well as for adapting drug dosage for patients, for drug screening purposes or for patient selection in phase or clinical studies. This polypeptide sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Identifying an increase in risk for type II diabetes mellitus, venous thrombosis, pulmonary embolism or its combination in subject by determining whether amino acid residue at position 286 of BDG5 protein is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    61 NSKFHSAMYLFLGNLAASDLLAGVAFVANTLLSGSVTLRLTPVQWFAREGSASITLSASV

                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to an isolated nucleic acid encoding a mammalian Edg7 receptor. The mammalian Edg7 receptor proteins and nucleic acid encoding the proteins are useful for diagnosing and treating an abnormality associated with the activity of the mammalian Edg7 receptors, cdiabetes, respiratory disorder, asthma, immune disorder, hypertension, disorder, memory disorder, asthma, immune disorder, copylitive disorder, migraine, cancer, AIDS, wound healing, or ischaemia-reperfusion injury-related diseases. The nucleic acids and proteins are also useful for developing and designing drugs with higher specificity and fewer side effects. The nucleic acid and antisense oligonucleorides concoling mammalian Edg7 receptors and antisense oligonucleorides complementary to the nucleic acid sequences. The methods are also useful for identifying agonists and antisense oligonucleorides complementary to the nucleic acid sequences. The methods are also useful for identifying agonists and antisense of Edg7 receptors. The present sequence represents the amino acid sequence of the human Edg5 receptor.
                                                                                                                                                                                                                                                   mammalian

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a compound 8-80 nucleobases in length targeted to, and which specifically hybridises with a nucleic acid molecule encoding endothelial differentiation gene 5 (EDG5, a G protein coupled receptor, involved in development, wound healing, tissue regeneration, cellular proliferation, apoptosis, cancer, angiogenesis and inflammation), and inhibits the expression of EDG5, i.e. is an antisense (AS) oligonucleotide. Also included are a composition comprising the compound and a carrier or diluent and a method for screening an antisense compound (by contacting a preferred target region of a nucleic acid molecule encoding EDG5 in preferred target region and selecting for one or more candidate antisense comprising at least an 8-nucleobase portion that is complementary to the preferred target region and selecting for one or more candidate antisense compounds to composition and methods are useful for treating a disease or condition associated with EDG5, such as a hyperproliferative disorder, developmental disorder or a disease or condition arising from aberrant modulating the expression of EDG5. Experimental prococols are described but no results are given. The present sequence is the human EDG5 protein.

compounds that modulates diagnosing and treating disease condition associated with GPCR dysfunction e.g. autoimmune diseases, angina pectoris, Parkinson's disease.

(first entry)

12-AUG-2004

ADOS 7997;

Claim 151; SEQ ID NO 394; 542pp; English.

The invention relates to human and mouse G protein-coupled receptors (GPCRs) and nucleic acids encoding them. The invention also relates to sequences at least 90% identical to the GPCR proteins and nucleic acids of the invention; methods of treating, preventing or diagnosing diseases of the invention; methods of treating, preventing or diagnosing diseases compounds useful in the treatment of GPCR-related diseases; a transgenic compounds useful in the treatment of GPCR-related diseases; a transgenic mouse comprising a GPCR gene of the invention; a mouse comprising a GPCR gene of the invention and kite comprising a mutation in a different GPCR gene of the invention. The invention in a different GPCR polymuclectides of the invention. The invention further discloses variants of the GPCR polypeptides and vectors comprising a GPCR uncleic acids and proteins may be used in the diagnosis, treatment or prevention of a wide variety of diseases including neurological disorders (e.g., Alzheimer's disease, disease, disease or schizophrenia); chisorders of the adrenal gland; disorders of the colon or intestine compounds disease, diarkhoea, food poisoning or irritable bowel syndrome); cardiovacular disorders (e.g., angina, cardiac arrhythmia or myocardial infarction); muscular disorders (e.g., autoimmune disorders (e.g., antoimmune disorders (e.g., autoimmune disorders (e.g., obselty, enzyme deficiency-related diseases or vitamin disorders of the kidney, liver, lung, breast, ovary, cuerns, prostere, teetles, shin, stomach, panceases, spleen, thymus and charactis, promers of the kidney, liver, lung, because of the myorder of the full sequence data for this patent did not form particles of the present sequence sor this patent did not form particles of the present sequence sor this patent and protein and diso electronic format directly from WIPO at ftp.wipo.int/pub/published pct_sequences.

ADO57997 standard; protein; 353 AA.

RESULT 15 ADO57997

cumputables; usequebating useases such as a carturovascular diseases, disorders of the gastroenterology system, reproductive diseases, disorders of the peripheral and central nervous system, and respiratory diseases in a mammal. The invention also comprises a pharmaceutical composition for the treatment of the diseases above comprising an EDG5 polypeptide, an EDG5 polypeptide, or a therapeutic agent which binds comprised, an antibody, or a ribozyme; and preparation of a polypeptide, an antibody, or a ribozyme; and preparation of a polypeptide, an antibody, or a ribozyme; and preparation of a polypeptide, an antibody, or a ribozyme; and preparation of a compositions have the following activities; analgesic, antiarrhythmic, antiarteriosclerotic, antiasthmatic, antiabcterial, antiarrhythmic, antiarteriosclerotic, antiasthmatic, antiabcterial, antiarrhythmic, antiarteriosclerotic, antiasthmatic, antiabcterial, composition for treating the above-defined corropic, vasotropic, and virucide. The regulators of EDG5 are useful corropic, vasotropic, and virucide. The regulators of EDG5 are useful corropic, vasotropic, and virucide. The regulators of EDG5 are useful corropic, and disorders of the peripheral and central nervous reproductive diseases, disorders of the gastroenterology system, correlations, and respiratory diseases in a mammal. They are also useful for the regulation of EDG5 activity in a mammal having the disease. Cardiovascular disease, includes heart failure, myocardial infarction, ischaemia, arriththmiae, and atherosclerosis. Examples of disorders of disorders of gastricis, gastric ulcers, and chronic pancreatitis. Examples of cardiovascular disorders are syphilis, gantal watts, importence, vaginitis, dysemenorchoes, and infertility Disorders of the peripheral and central nervous system include Parkinson's disease, dementia, multiple sclerosis, crocke, and Alzheimer's disease. Respiratory diseases can be asthma or EDG5; cardiovascular disease; gastroenterology system; reproductive; peripheral; central nervous system; respiratory; analgesic; antiarrhythmic; antiarteriosclerotic; antiasthmatic; antibacterial; antiinfermatory; antiparkinsonian; antiulcer; cardiant; cerebroprotective; dermatological; synecological; neuroprotective; nootropic; vasotropic; virucide; human. Screening for therapeutic agents, useful for treating e.g. respiratory disease, comprises contacting a test compound with endothelial differentiation sphingolipid G-protein-coupled receptor 5 polypeptide and agents. The method comprises contacting a test compound with an endotherlial differentication sphingoliphid G-protein-coupled receptor 5 (EDGS) polypeptide or polymucleotide and detecting binding of the test compound, or determining EDGS polypeptide activity at a certain test compound concentration or in the absence of the test compound and at a different concentration of the test compound. The invention further comprises: diagnosing diseases such as a cardiovascular diseases, The invention relates to a novel method for screening for therapeutic endothelial differentiation sphingolipid; G-protein-coupled Disclosure; SEQ ID NO 2; 119pp; English. chronic obstructive pulmonary disease. The nucleotide sequences encoding EDG5 are useful as hybridization probes, in constructing oligomers for PCR, for chromosome and gene mapping, in the recombinant production of EDG5, in generating antisense DNA or RNA and in molecular biology techniques that have not yet been developed. EDG5 polypeptides are useful for immunising a mammal to produce polyclonal antibodies and for diagnostic purposes. This sequence represents the human EDG5 receptor protein of the invention.
